

# Application of AI

AI finds extensive application across various sectors including e-commerce, Education, Robotics, Healthcare and social media.

## E-commerce

\* Artificial Intelligence in the field of E-commerce helps the organization to establish a good engagement between the user and the company. AI chatbots are used to provide customer support instantly and help to reduce complaints and queries to a great extent.

- \* Personalization
- \* Dynamic Pricing Structure
- \* Voice Search

## Education Purpose

\* Educationally sectors were totally organized and managed by human involvement till some years back. But these days, the educational sector is also coming under the influence of Artificial Intelligence.

\* Voice Assistant: With the help of algorithm, this feature can be used in multiple ways to save time and provide help to assist user when required.

\* Smart Content creation: It uses algorithms to detect, predict and design content and provide valuable insights based on user interact which can include video, audio, infographics etc

## Robotics

Artificial Intelligence is one of the major technologies that provide the robotics field with a boost to increase their efficiency. AI provides robots to make decision in realtime and increase productivity.

**Autonomous Navigation:** AI equips robotics including self-driving cars and drones to navigate through complex environments by using sensors.

**Healthcare Robotics:** Robots powered by AI assist in surgeries and patient care bring precision to the medical procedures and support in recovery.

## GPS and Navigations

GPS technology uses AI to provide the best available route to the user for traveling. It helps the user to choose their type of lane and roads for which increases the safety feature of a user.

**Voice Assistance:** This feature allows users to interact with AI using a hand-free feature which allows them to drive while communicating with the navigation system.

**Predictive traffic Analysis:** Using historical data and machine learning predictions enable the navigation app to suggest for the best possible time to travel.

## Healthcare:

Various algorithms are used to build precise machines that are able to detect disease inside the human body.

Artificial Intelligence is also used to find the current vacant beds.

in the hospital of a city that saves the time of patients who are in emerging conditions

**Medical Imaging and Diagnostics:** AI algorithms detect problems like cancer, heart disease and neurological problems from medical images such as X-rays, MRI and CT scans.

**Virtual health assistants:** AI powered chatbots and virtual assistants are used for patient support, scheduling appointments, and monitoring chronic conditions.

**Automobiles:**

It makes the automotive industry vehicle smarter, safer and more efficient. AI technologies are transforming how cars are designed and driven.

- \* Predictive Maintenance
- \* V2X Communication
- \* Driver Behaviour Monitoring

**Agricultures:**

\* It is used to detect various parameters such as the amount of water and moisture, amount of deficient nutrients etc in the soil. There is also a machine that uses AI to detect where the weeds are growing and soil is infertile.

- \* Stock Monitoring
- \* Pest Management
- \* Forecasting

**Human Resource:**

The online selection processes are done using the voice and camera permission of the candidate's device. Here AI,

is used to detect any kind of malpractice behaviour and many other things.

- \* Screening
- \* Onboarding
- \* Workforce planning

Lifecycle:

- \* Some example of AI impact on lifecycle are spam filters in the mail, fraud call detection, face unlock of mobile in our mobile, and laptop etc.
- \* Virtual Assistants
- \* Personalized Recommendations
- \* Smart Home Devices

Social Media:

Social Media platform such as Facebook, Instagram uses AI to show relevant content to the user.

Fraud Detection: AI uses algorithm to spot and remove any fake accounts that are associated with any social media platform. Fraudsters generally use those accounts to perform unethical activities.

Sentiment Analysis: People are more connected and likely to spend more time on social media platform.

Gaming:

AI is used to make a human like situation in games. Various modern games use real world simulation for gaming.

**Adaptive Difficulty:** The AI can adjust the level of difficulty of the game in real time depending on a player's skill-level. If the is struggling, AI can ease him and if it find him going through easy sides through levels.

### Astronomy

\* AI is used to investigate galaxy mergers and stars to protect the future of human beings. The movement of stars in the sky is recorded for the whole day and night

\* Analysis

\* Detection and classification

### Chatbots:

Chatbots are defined as the tool that is used to represent the text that is given to them as input. The customer or user send the query according to their need and the chatbot gives the most appropriate output to provide solution.

\* NLP

\* Multi-Language

\* Adaptation

### Surveillance

It is also used in the field of surveillance by recognizing faces and objects. This helps the military to protect their area and prevent any attack in real time

\* Object Detection

\* Predictive Analysis

\* Behaviour Analysis
